This pilot study examined the efficacy of a novel home-based social engagement intervention for children with autism spectrum disorder (ASD). The Social Play (SP) intervention included a combination of socialization and play activities in the home. Thirty-four parents completed a parent-report measure of social engagement at baseline and post-intervention. Parents also completed parent reports of their children's social engagement and autistic-specific quality of life. Significant improvements in parent-reported social engagement were evident for the intervention group compared with wait-list control. Improvements in social engagement were not accompanied by improvements in autism-specific quality of life or socialization. Further research is required to determine the effects of home-based social engagement interventions on broader measures of social functioning and wellbeing in ASD.**How to cite this article:** Li Y, Niu Y, Zhang J, Zhang L, Zhao C, Gao D, Tan X, Qi X.
